Subject: URGENT: Escalation - Critical Ransomware Alert on Server-X

To: Tier 2 Incident Response Team

From: Aditya Singh (SOC Analyst)

Team,

I am escalating a Critical priority alert regarding a confirmed ransomware infection on Server-X. The alert initially triggered at 14:05 UTC. I have logically isolated the host from the network to prevent lateral movement, but the payload appears to have executed.

Key Indicators of Compromise (IOCs):

- **Malicious IP (C2):** 192.168.1.50
- **Suspicious File:** crypto_locker.exe
- **SHA256 Hash:** 8d969eef6ecad3c29a3a629280e686cf0c3f5d5a86aff3ca12020c923adc6c92

Please advise on immediate next steps for memory forensics, reverse engineering the payload, and eradication procedures. I have attached the initial triage logs to the TheHive ticket (INC-0042).

Best,

Aditya Singh
(SOC Analyst)
